Q3	b)	In a screening test for a disease. The frequency of the disease in a population is 0.5%. The test is highly accurate with 5% false positive rate and 10% false negative rate. A person takes the test and it comes positive. Construct a decision tree and use Baye’s theorem to determine the probability that he has a disease?	(10)
----	----	---	------

SOLN

DEFINE THE EVENTS

D+ : The person has a disease, D - : The person does not have a disease

T+ : The test is positive, T - : the test is negative

Given: P(D+)=0.5 % = 0.005, P(D-)=0.995

P(false positive) is probability that (Test is positive, given the person does not have disease)

P(false positive) =P(T+|D-)=0.05, P(false negative)=P(T-|D+)=0.1

The Complimentary probabilities are

P(true negative)= P(T-|D-) = 1- P(T+|D-) = 1-0.05 = 0.95

P(true positive)= P(T+|D+) =1- P(T-|D+)=1-0.1=0.9

Decision Tree:

We have to find $P(D + |T +)$

Using Bayes Theorem,

We have to find
$$P(D + |T +) = \frac{P(T+|D+) P(D+)}{P(T+)} \quad \dots \text{Eq1}$$

$P(T+)=0.05 \times 0.995 + 0.9 \times 0.005 = 0.05425$

$P(T+|D+)=0.9, P(D+)=0.005$

By Eq1
$$P(D + |T +) = \frac{(0.9 \times 0.005)}{0.05425} = 0.082949$$
