

SNMP

**SIMPLE NETWORK MANAGEMENT
PROTOCOL**

WHAT IS NETWORK MANAGEMENT?

Basic tasks that fall under this category are

- **Configuration management**
 - Keeping track of device settings and how they function
- **Fault Management**
 - Dealing with problems and emergencies in the network (router stops routing, server loss power etc..)
- **Performance Management**
 - How smoothly is the network running?
 - Can it handle the workload it currently has?
- **Network management interface must be standardized, extendible, and portable**
- **The management mechanism must be inexpensive and implemented as software only.**

FUNCTIONAL AREAS OF NETWORK MANAGEMENT

Configuration Management – inventory, configuration, provisioning

Fault Management – reactive and proactive network fault management

Performance Management – No. of packets dropped, timeouts, collisions, CRC errors

Security Management –controlling access to the network

Accounting Management – cost management and chargeback assessment

Asset Management – Statistics of equipment, facility and administration personnel

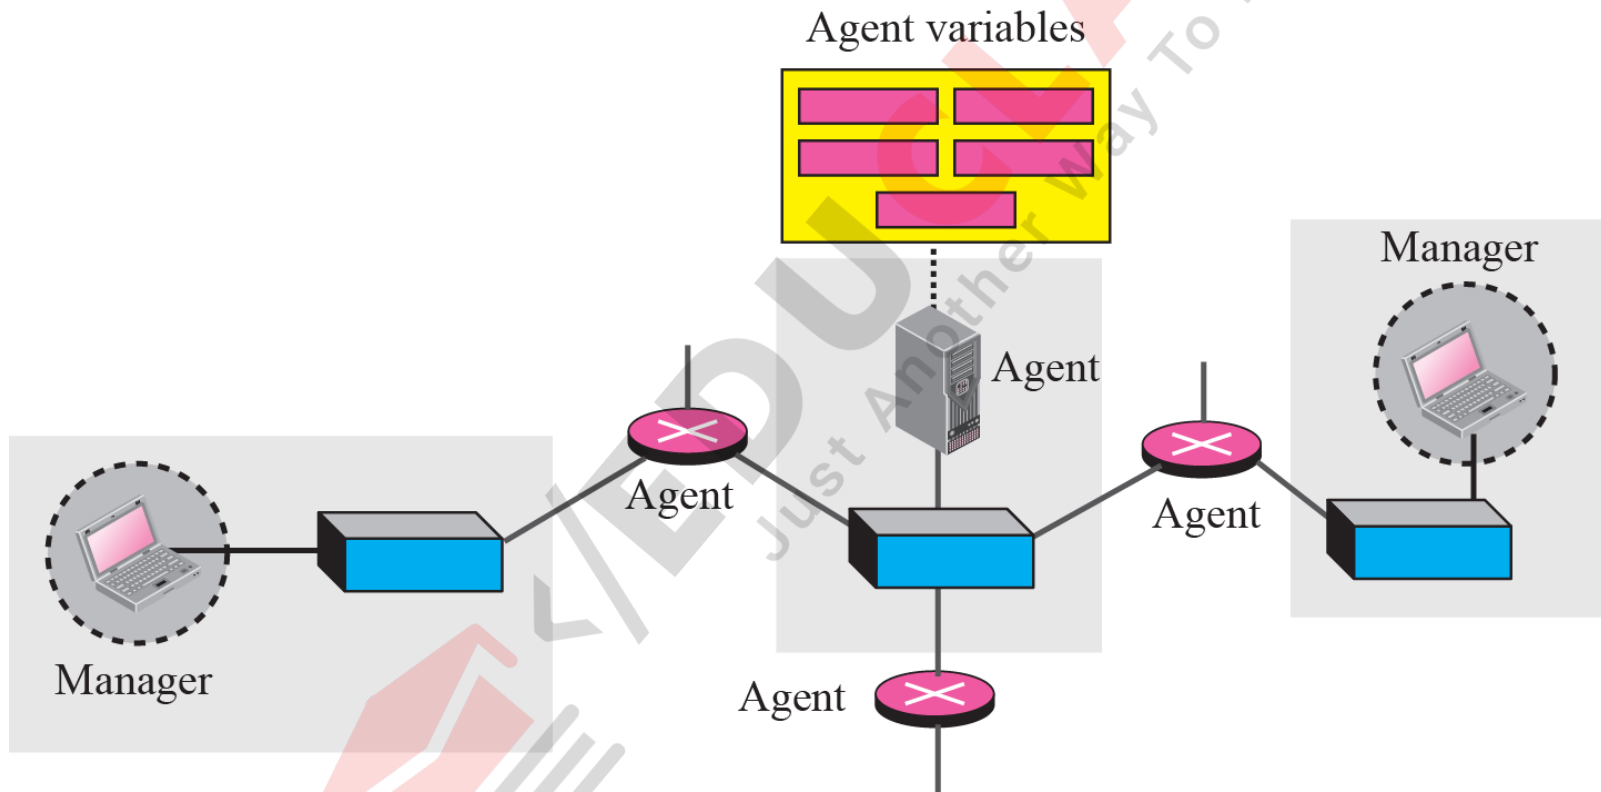

Planning Management – Analysis of trends to help justify a network upgrade or bandwidth increase

WHAT IS SNMP?

- **SNMP is a tool (protocol) that allows for remote and local management of items on the network including servers, workstations, routers, switches and other managed devices**
- **Comprised of agents and managers**
 - Agent – process running on each managed node collecting information about the device it is running on
 - Manager – process running on a management workstation that requests information about devices on the network.

SNMP CONCEPT

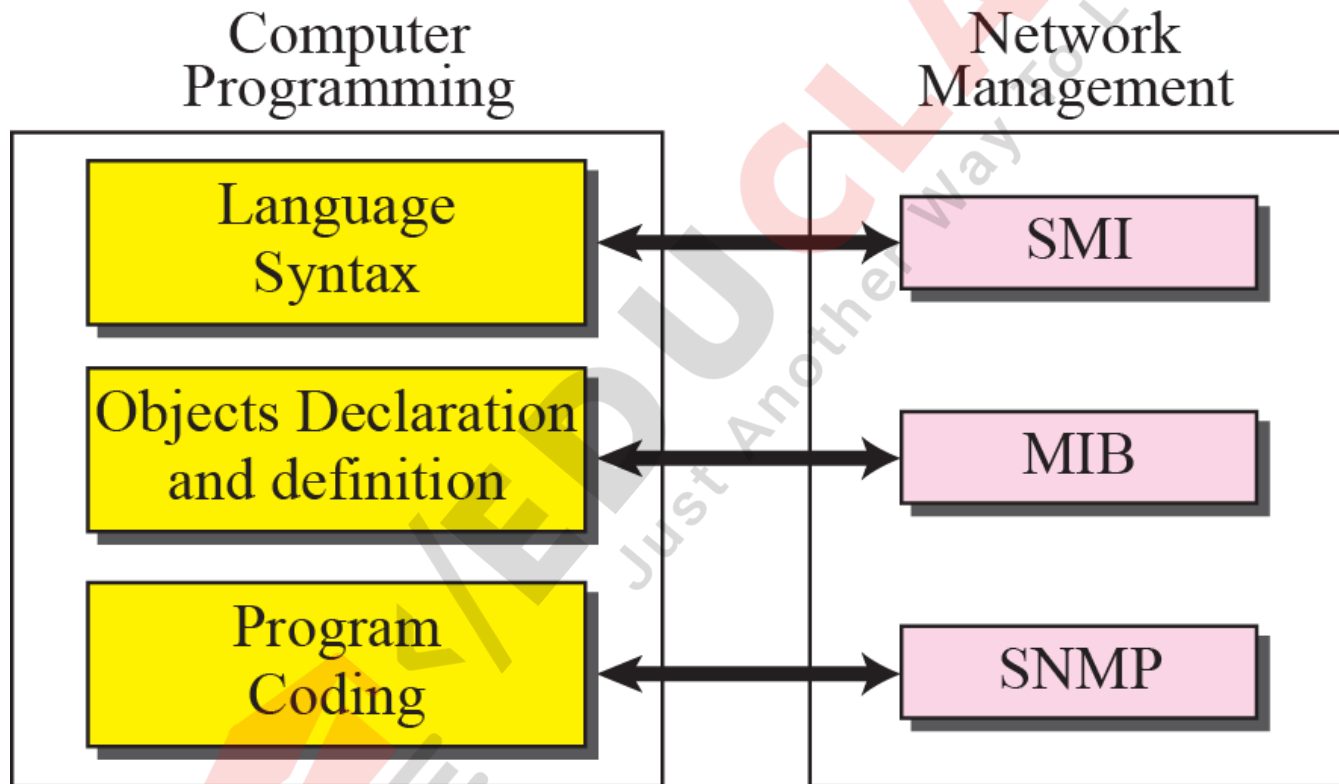

CLIENT PULL & SERVER PUSH

- **SNMP is a “client pull” model**
 - The management system (client) “pulls” data from the agent (server)
- **SNMP is a “server push” model**
 - The agent (server) “pushes” out a trap message to a (client) management system

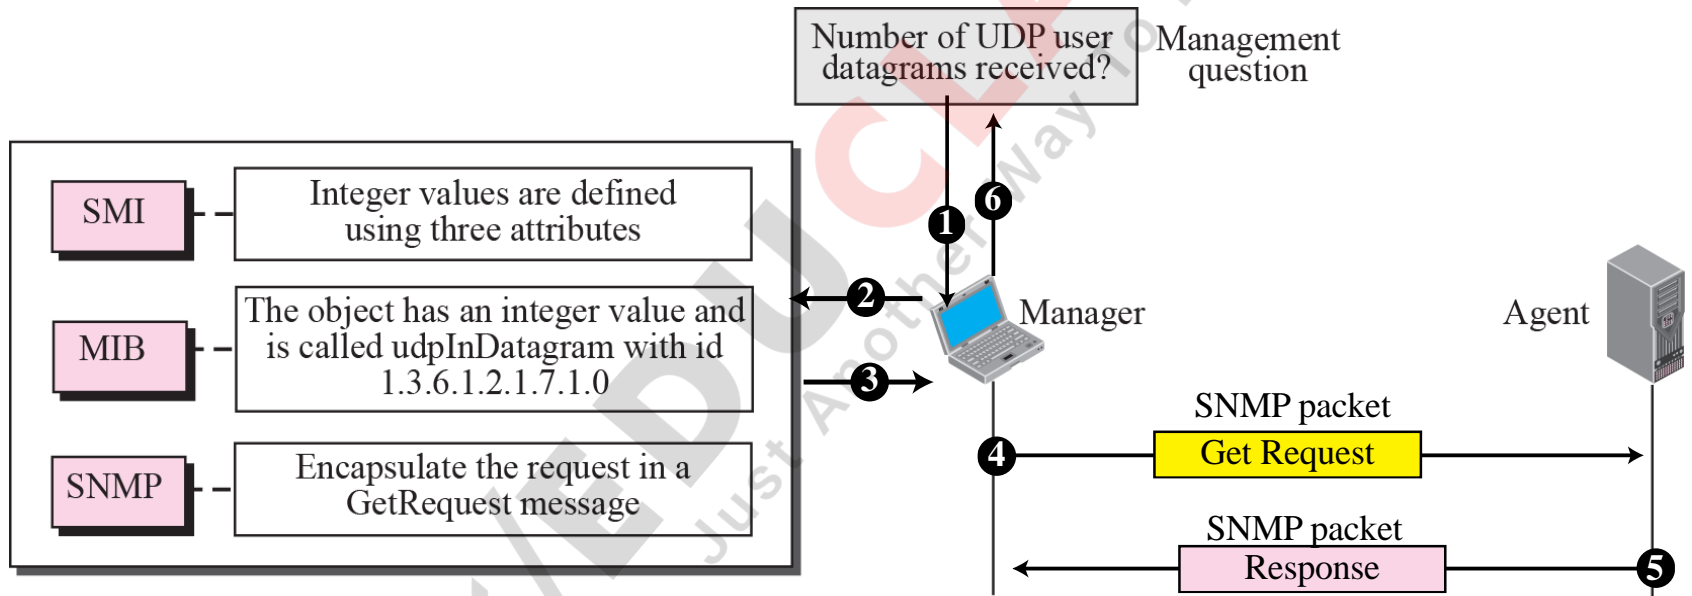

COMPONENTS OF SNMP

- **SNMP network management is based on three parts**
 - **SNMP Protocol**
 - Defines format of messages exchanged between agents and managers
 - It reads and changes the status of objects in SNMP packets
 - **Structure of Management Information (SMI)**
 - Rules specifying the format used to define objects managed on the network that the SNMP protocol accesses
 - **Management Information Base (MIB)**
 - A map of the hierarchical order of all managed objects and how they are accessed

COMPARISON – PROGRAMMING VS NETWORK MANAGEMENT

EXAMPLE

LANGUAGES OF SNMP

- **SMI**
 - Specifies the format for defining managed objects that are accessed via the SNMP protocol
- **Abstract Syntax Notation One (ASN.1)**
 - Used to define the format of SNMP messages and managed objects using an unambiguous data description format
- **Basic Encoding Rules (BER)**
 - Used to encode the SNMP messages into a format suitable for transmission across a network

SMI

- **The functions of SMI are**
 - To name objects
 - To define the type of data that can be stored in an object
 - To show how to encode data for transmission over the network

OBJECT IDENTIFIER

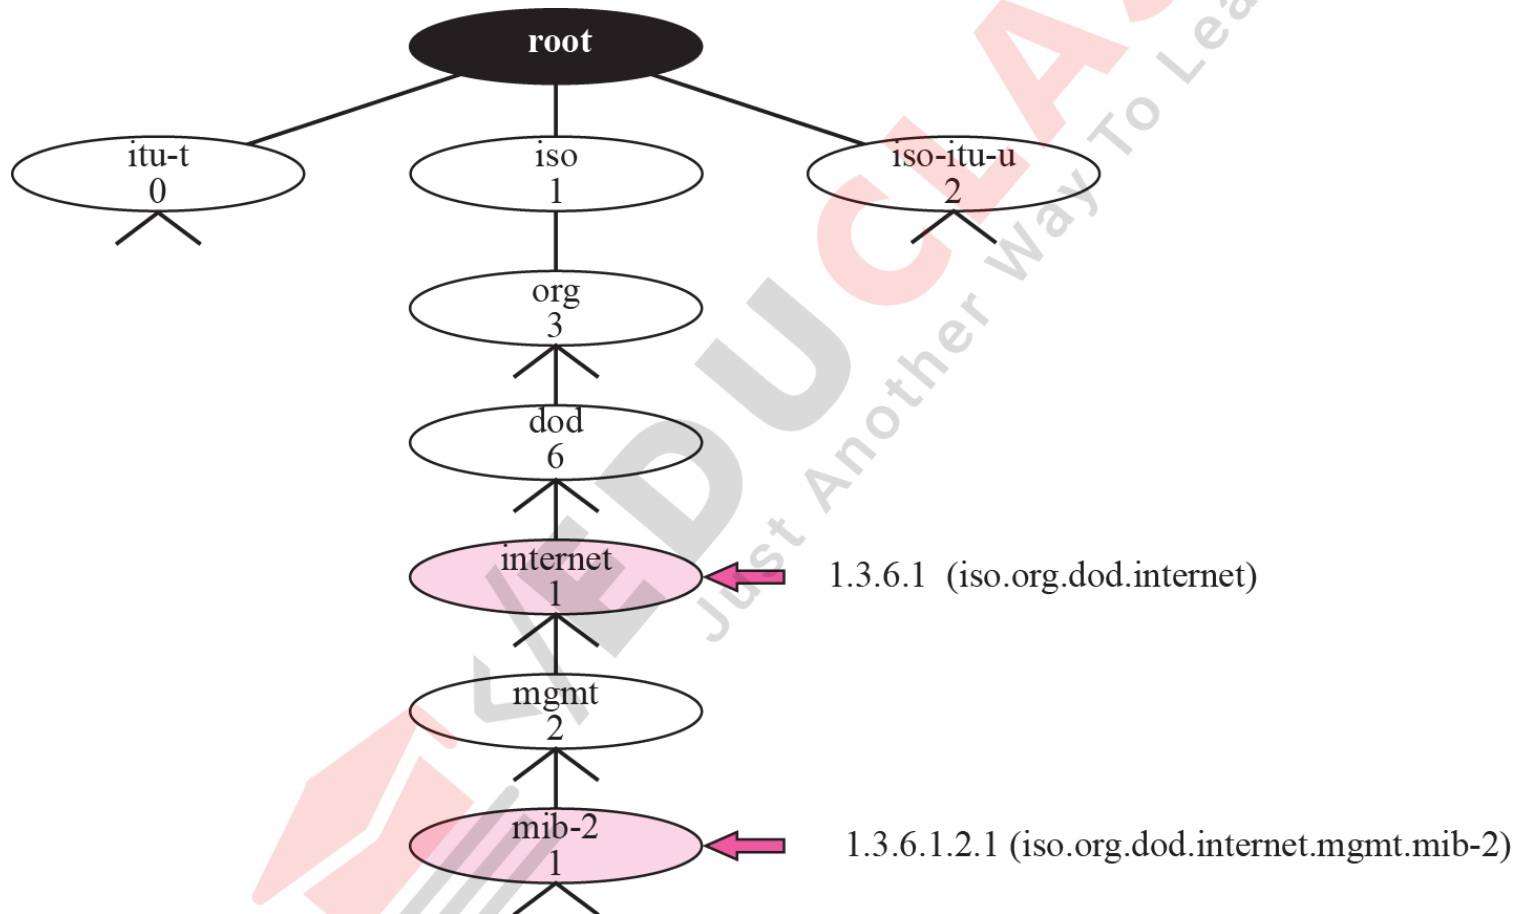

Table 24.1 *Data Types*

Type	Size	Description
INTEGER	4 bytes	An integer with a value between -2^{31} and $2^{31}-1$
Integer32	4 bytes	Same as INTEGER
Unsigned32	4 bytes	Unsigned with a value between 0 and $2^{32}-1$
OCTET STRING	Variable	Byte-string up to 65,535 bytes long
OBJECT IDENTIFIER	Variable	An object identifier
IPAddress	4 bytes	An IP address made of four integers
Counter32	4 bytes	An integer whose value can be incremented from zero to 2^{32} ; when it reaches its maximum value it wraps back to zero
Counter64	8 bytes	64-bit counter
Gauge32	4 bytes	Same as Counter32, but when it reaches its maximum value, it does not wrap; it remains there until it is reset
TimeTicks	4 bytes	A counting value that records time in 1/100ths of a second
BITS		A string of bits
Opaque	Variable	Uninterpreted string

CONCEPTUAL DATA TYPES

a. Simple variable

c. Sequence

b. Sequence of
(simple variables)

d. Sequence of
(sequences)

ENCODING FORMAT

Length field

Table 24.2 *Codes for Data Types*

<i>Data Type</i>	<i>Tag (Binary)</i>	<i>Tag (Hex)</i>
INTEGER	00000010	02
OCTET STRING	00000100	04
OBJECT IDENTIFIER	00000110	06
NULL	00000101	05
Sequence, sequence of	00110000	30
IPAddress	01000000	40
Counter	01000001	41
Gauge	01000010	42
TimeTicks	01000011	43
Opaque	01000100	44

INTEGER 14

02	04	00	00	00	0E
00000010	00000100	00000000	00000000	00000000	00001110
Tag (integer)	Length (4 bytes)	Value (14)			

OCTET STRING "HI"

04	02	48	49
00000100	00000010	01001000	01001001
Tag (String)	Length (2 bytes)	Value (H)	Value (I)

Object Identifier 1.3.6.1

06	04	01	03	06	01
00000110	00000100	00000001	00000011	00000110	00000001
Tag (ObjectId)	Length (4 bytes)	Value (1)	Value (3)	Value (6)	Value (1)
1.3.6.1 (iso.org.dod.internet)					

IPAddress 131.21.14.8

40	04	83	15	0E	08
01000000	00000100	10000011	00010101	00001110	00001000
Tag (IPAddress)	Length (4 bytes)	Value (131)	Value (21)	Value (14)	Value (8)
131.21.14.8

SNMP

- **SNMP uses both SMI and MIB in network management. It is an application program that allows**
 - A manager to retrieve the value of an object defined in an agent
 - A manager to store a value in an object defined in an agent
 - An agent to send an alarm message about an abnormal situation to the manager.

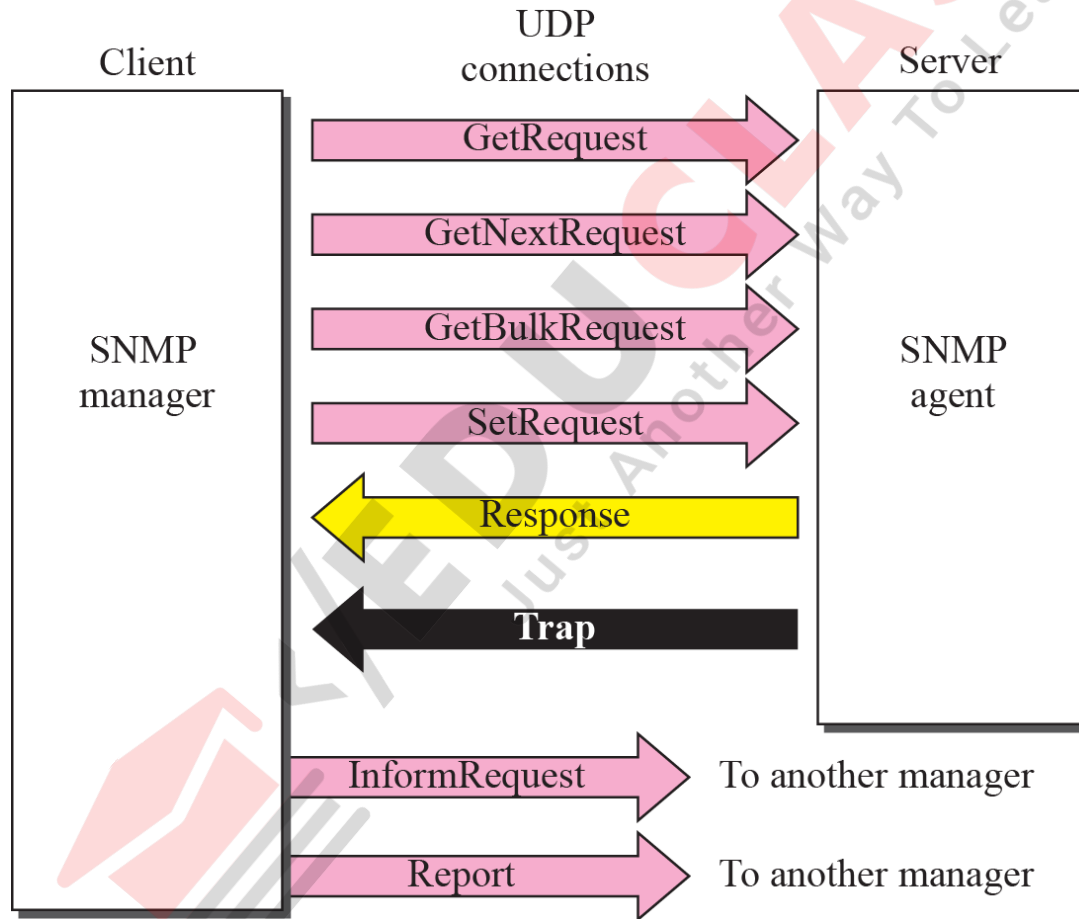

BASIC OPERATIONS

- **Get**
 - Retrieves the value of MIB variable stored on the agent machine
- **GetNext**
 - Retrieves the next value of the next lexical MIB variable
- **Set**
 - Changes the value of a MIB variable
- **Trap**
 - An unsolicited notification sent by an agent to a management application

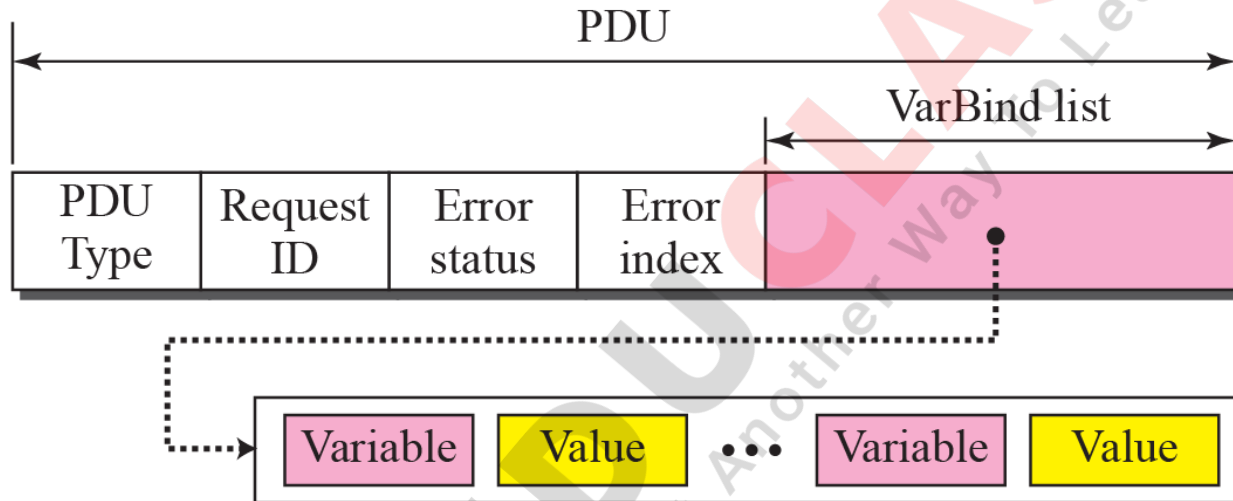

TRAPS

- Traps are unrequested event reports that are sent to a management system by an SNMP agent process
- When a trappable event occurs, a trap message is generated by the agent and is sent to a trap destination (a specific, configured network address)
- Many events can be configured to signal a trap, like a network cable fault, failing NIC or Hard Drive, a “General Protection Fault”, or a power supply failure
- Traps can also be throttled -- You can limit the number of traps sent per second from the agent
- Traps have a priority associated with them -- Critical, Major, Minor, Warning, Marginal, Informational, Normal, Unknown

SNMP PDUS

SNMP PDU FORMAT

Differences:

1. Error status and error index values are zeros for all request messages except GetBulkRequest.
2. Error status field is replaced by non-repeater field and error index field is replaced by max-repetitions field in GetBulkRequest.

Table 24.3 *PDU Types*

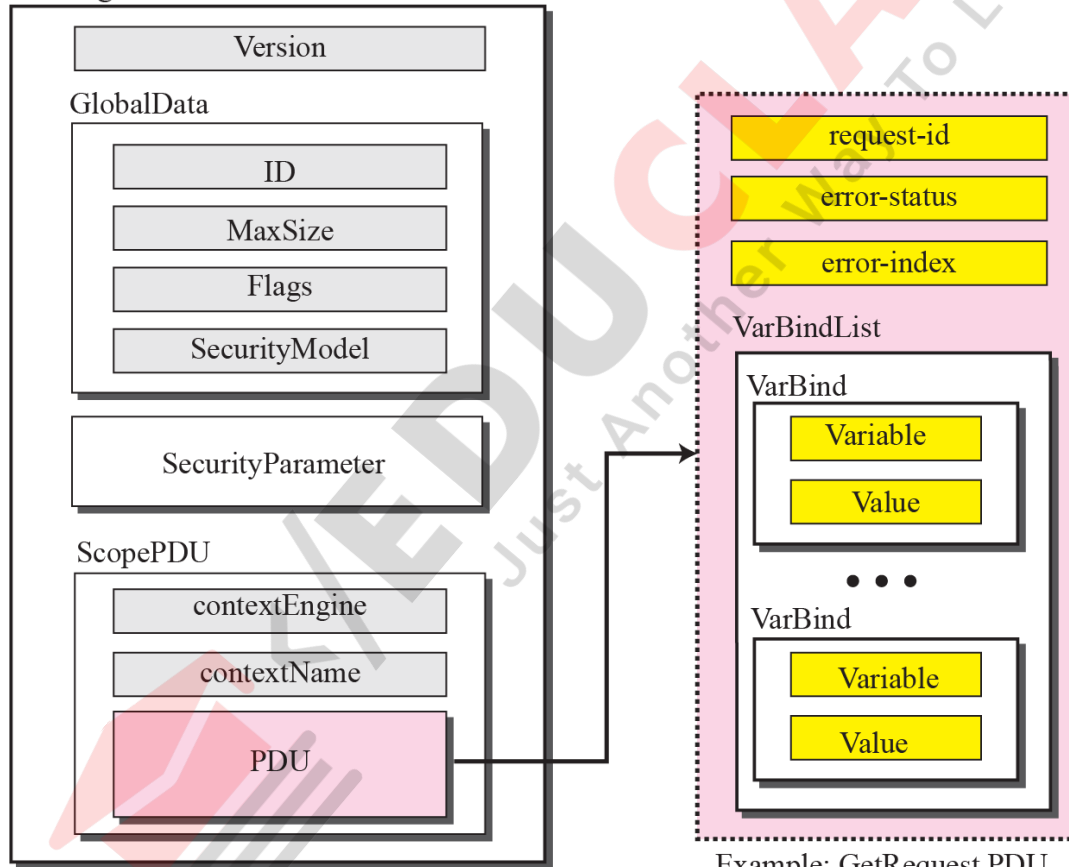

<i>Type</i>	<i>Tag (Binary)</i>	<i>Tag (Hex)</i>
GetRequest	10100000	A0
GetNextRequest	10100001	A1
Response	10100010	A2
SetRequest	10100011	A3
GetBulkRequest	10100101	A5
InformRequest	10100110	A6
Trap (SNMPv2)	10100111	A7
Report	10101000	A8

Table 24.4 *Types of Errors*

<i>Status</i>	<i>Name</i>	<i>Meaning</i>
0	noError	No error
1	tooBig	Response too big to fit in one message
2	noSuchName	Variable does not exist
3	badValue	The value to be stored is invalid
4	readOnly	The value cannot be modified
5	genErr	Other errors

SNMP MESSAGE

Message

PORTS & UDP

- **SNMP uses User Datagram Protocol (UDP) as the transport mechanism for SNMP messages**

- **It uses two well-known ports**
 - Port 161 – SNMP messages
 - Port 162 – SNMP Trap Messages

PORT NUMBERS FOR SNMP

a. Passive open by both client and server

b. Exchange of request and response messages

c. Server sends trap message
